NAME : XXXXXXXXXXXXXXXXXXXXXXXXX
REF. BY : XXXXXXXXXXXXXXXXXXXXXXXXX
TEST ASKED : HEPATITIS PANEL

HOME COLLECTION :

PATIENTID : XXXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI HEPATITIS A VIRUS (ANTI HAV) - IGM	C.M.I.A	0.07	S / CO

Bio. Ref. Interval. :-

Negative : < 0.80 (Non Reactive)
Equivocal: 0.80 - 1.20 (Borderline Reactive)
Positive : > 1.20 (Reactive)

Clinical Significance:
During the acute phase of HAV infection, IgM Anti-HAV appears in the patient's serum and is nearly always detectable at the onset of symptoms. In most cases, IgM Anti-HAV response usually peaks within the first month of illness and can persist for up to six months. For diagnostic purpose, results should always be assessed in conjunction with the patients medical history, clinical examination and other findings.

Specifications:
Precision: Intra assay (%CV): 11.33 %, Inter assay (%CV): 13.10%; Specificity of 99.0% and sensitivity of 95.0%

Kit validation references :
Locarnini SA, Ferris AA, Lehmana NL, ET AL. The antibody response following Hepatitis A Infection. Intervirology 1977;8(5): 309-18.

TEST ASKED : HEPATITIS PANEL

HOME COLLECTION :

PATIENTID : XXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI HEPATITIS E VIRUS (Anti HEV) - IgM	E.L.I.S.A	0.29	OD Ratio

Bio. Ref. Interval. :-

Negative : < 1.00
Positive : > = 1.00

Clinical Significance:

Hepatitis E is usually an acute infection and does not become a chronic illness. On rare occasions the acute illness can take fulminant shape; pregnant women are at higher risk of fulminant liver failure. The great majorities of patients who recover from acute infection do not continue to carry HEV and cannot pass on the infection to others. For diagnostic purpose, results should always be assessed in conjunction with the patients medical history, clinical examination and other findings.

Specifications:
Sensitivity: 100%, Specificity:100%

Kit validation references:
Labrique ABmThomas DL,Stoszek SK,et al: Hepatitis E:an emerging infectious diseases,Epidemiol.Rec. 1999;21:162-179

Please correlate with clinical conditions.

TEST ASKED : HEPATITIS PANEL

PATIENTID : XXXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
HEPATITIS B ENVELOPE ANTIBODY	**C.M.I.A**	**1.04**	**S / CO**

Bio. Ref. Interval. :
Positive : < = 1.01
Equivocal : 1.01 - 1.10
Negative : > = 1.11

* Competitive Assay : Lower value indicates positivity.

Clinical Significance :

Anti HBE is first detected, Only after the complete disappearance of Hepatitis B Envelope Antigen (HBeAg). Seroconversion from HbeAg to Anti-HBE during Acute Hepatitis B Infection is usually indicative of resolution of infection and a reduced level of Infectivity. For Diagnostic Purpose, Results should always be assessed in conjunction with the patient's medical history, Clinical examination and other findings.

Specifications:
Precision: Intra assay (%CV): 5.29 Inter assay (%CV): 5.68, Sensitivity: 99.5%, Specificity: 99.5%

Kit Validation References:

TEST ASKED : HEPATITIS PANEL

PATIENTID : XXXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
HEPATITIS B ENVELOPE ANTIGEN (HBEAG)	C.M.I.A	0.63	S / CO

Bio. Ref. Interval. :
Negative : < 1.00
Positive : > = 1.00

Clinical Significance:

HbeAg is first detectable in the early phase of Hepatitis B Viral Infection, after the appearance of Hepatitis B Surface Antigen (HBsAg). The titers of both antigen rise rapidly during the period of viral replication in acute replication. The presence of HBeAg correlates with increased numbers of infectious virus and the presence of Hepatitis B Virus specific DNA and DNA polymerase in serum. HBeAg may persist together with HBsAg in chronic Hepatitis B Viral infection. For diagnostic purpose, Results should always be assessed in conjunction with the patients medical history, clinical examination and other findings.

Specifications:
Precision: Intra assay (%CV):12.40 %, Inter assay (%CV): 13.36%; Specificity: >=99.5%; Sensitivity: >= 99.5%

NAME :XXXXXXXXXXXXXXXXXXXXXXXXX
REF. BY :XXXXXXXXXXXXXXXXXXXXXXXXX
TEST ASKED : HEPATITIS PANEL

HOME COLLECTION :

PATIENTID :XXXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI HEPATITIS A VIRUS (HAV) - TOTAL	E.L.I.S.A	0.62	OD Ratio

Bio. Ref. Interval. :-

Negative : < 0.90
Equivocal: 0.90 - 1.10
Positive : > 1.10

* Equivocal result should be retested after 2 weeks.

Clinical significance:

The onset of hepatitis a is always accompanied by detectable and usually high levels of Anti-HAV. A negative result for a patient therefore excludes hepatitis a as a cause of illness. After an infection, Anti-HAV remains detectable for a lifetime, so that detection of Anti-HAV is indicative of current immunity, an essential criterion in deciding whether to supply active immunization by vaccination or to administer immunoglobulins for post-exposure prophylaxis in at-risk contacts.

NAME :XXXXXXXXXXXXXXXXXXXXXXXXX
REF. BY :XXXXXXXXXXXXXXXXXXXXXXXXX
TEST ASKED : HEPATITIS PANEL

HOME COLLECTION :

PATIENTID :XXXXXXXXXXXXXXXXXXXXXXXXX

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI HEPATITIS B CORE ANTIGEN (AHBC) - IGM	C.L.I.A	0.15	Index

Bio. Ref. Interval. :-

Negative : < 0.80
Equivocal : 0.80 - 0.99
Positive : > = 1.00

Clinical Significance :

Classification of a hepatitis B infection requires the identification of several serological markers of the infection. The first marker to appear during the incubation phase is HBsAg, and indicates infection with HBV. Anti -HBC appears shortly after the appearance of HBsAg and peaks during the acute phase prior to the appearance of Anti-HBs. IgM antibody to the core antigen will decline in uncomplicated acute infection, whereas IgG antibody will persist for years. Presence of IgM and total Anti-HBC indicates an ongoing or recent HBV infection. When used in conjunction with tests for other HBV serological markers, a laboratory diagnosis or a rule out of HBV infection can be achieved. For diagnostic purpose, results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings.

Specifications:

Specificity: 100%; Sensitivity: 97.55%

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI HEPATITIS B SURFACE ANTIGEN - TOTAL	**C.M.I.A**	**62.96**	**mIU/mL**

Bio. Ref. Interval. :-

Negative : < 10.0 mIU/mL
Positive : >= 10.0 mIU/mL

Clinical Significance:

Classification of a hepatitis B infection requires the identification of several serological markers of the infection. The first marker to appear during the incubation phase is HBsAg, and indicates infection with HBV. Antibodies to HBsAg generally appears after HBsAg has been cleared from the blood stream, usually 6 months after infection, and its presence represents recovery and immunity. The presence of HBsAg antibodies should not be used as the sole marker in determining a prior hepatitis b infection. For diagnostic purpose, results should always be assessed in conjunction with the patients medical history, vaccination history, clinical examination and other findings. Based on WHO recommendation, an Anti-HBS concentration >=10.0 mIU/mL is regarded as being protective against Hepatitis B viral infection.

Specifications:
Precision: Intra assay (%CV): 6.5, Inter assay (%CV): 8.6, Specificity: 99.67%, Sensitivity: 97.54%

ANTI HEPATITIS C VIRUS (ANTI HCV) - TOTAL	C.M.I.A	0.1	OD ratio

Reference range :

NON REACTIVE : < 1.0
REACTIVE : > = 1.0

Method:
FULLY AUTOMATED CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY

Clinical significance:
Hepatitis C Virus (HCV) is now recognized as the primary cause of transfusion-associated Non-A, Non-B Hepatitis. The biochemical changes occurring in a Hepatitis C Virus-infected person are increased levels of serum transaminases. The acute presentation of HCV infection is generally mild, often clinically asymptomatic, with only 10 - 25 % of patients developing jaundice, greater than 50% of infected individuals go on to develop chronic hepatitis with serious and possibly life threatening sequel such as cirrhosis and Hepatocellular Carcinoma..

Note: Repeatedly reactive anti HCV specimens should be investigated further in supplemental tests such as other HCV specific immunoassays and immunoblot assays or a combination thereof and/or NAT tests.

Specifications: Precision: Intra assay (%cv): 3.9 %, Inter assay (%cv): 4.5 % Sensitivity: 99.10 % ; Specificity: 99.60%

HOME COLLECTION :

TEST NAME	TECHNOLOGY	VALUE	UNITS
HEPATITIS B SURFACE ANTIGEN (HBSAG)	E.C.L.I.A	0.44	OD ratio

Non reactive: < 0.90
Border line : >=0.90 to < 1.0
Reactive : >= 1.0

Clinical Significance:
Hepatitis B Surface Antigen test is a screening test and is being performed using solid phase enzyme immunoassay. A positive report does not confirm diagnosis and all positive cases should be confirmed by confirmatory test like PCR. Type B viral hepatitis is usually accompanied by the appearance of hepatitis B surface antigen in the serum. HBsAg can be detected in the serum as early as 2 to 3 weeks before the onset of the illness and reaches a peak titre at the time when the characteristic symptoms like jaundice and changes in the liver-specific enzymes appear. This is normally followed by a gradual elimination of the antigen. In some cases and in an unknown percentage of subclinical hepatitis b virus infections, the antigen can be detected in the serum for years, if not for life. Despite the high sensitivity of HBsAg assays, a risk of the transmission of hepatitis B by an HBsAg -negative sample cannot be ruled out.

Specifications:
Precision: Intra assay (%CV): 14.6 %, Inter assay (%CV): 11.6 % ,Sensitivity: 99.90%; Specificity:100%

CONDITIONS OF REPORTING

- The reported results are for information and interpretation of the referring doctor only.
- It is presumed that the tests performed on the specimen belong to the patient; named or identified.
- Results of tests may vary from laboratory to laboratory and also in some parameters from time to time for the same patient.
- Should the results indicate an unexpected abnormality, the same should be reconfirmed.
- Only such medical professionals who understand reporting units, reference ranges and limitations of technologies should interpret results.
- This report is not valid for medico-legal purpose.
- Neither Thyrocare, nor its employees/representatives assume any liability, responsibility for any loss or damage that may be incurred by any person as a result of presuming the meaning or contents of the report.
- Thyrocare Discovery video link :- https://youtu.be/nbdYeRgYyQc
- For clinical support please contact @8450950852,8450950853,8450950854 between 10:00 to 18:00

EXPLANATIONS

- Majority of the specimen processed in the laboratory are collected by Pathologists and Hospitals we call them as "Clients".
- **Name** - The name is as declared by the client and recored by the personnel who collected the specimen.
- **Ref.Dr** - The name of the doctor who has recommended testing as declared by the client.
- **Labcode** - This is the accession number in our laboratory and it helps us in archiving and retrieving the data.
- **Barcode** - This is the specimen identity number and it states that the results are for the specimen bearing the barcode (irrespective of the name).
- **SCP** - Specimen Collection Point - This is the location where the blood or specimen was collected as declared by the client.
- **SCT** - Specimen Collection Time - The time when specimen was collected as declared by the client.
- **SRT** - Specimen Receiving Time - This time when the specimen reached our laboratory.
- **RRT** - Report Releasing Time - The time when our pathologist has released the values for Reporting.
- **Reference Range** - Means the range of values in which 95% of the normal population would fall.

SUGGESTIONS

- Values out of reference range requires reconfirmation before starting any medical treatment.
- Retesting is needed if you suspect any quality shortcomings.
- Testing or retesting should be done in accredited laboratories.
- For suggestions, complaints or feedback, write to us at **info@thyrocare.com** or call us on **022-3090 0000 / 6712 3400**
- SMS:<Labcode No.> to **9870666333**

**As per a survey on doctors' perception of laboratory diagnostics (IJARIIT,2023)*
